

Information Security & Privacy

Different areas of expertise: one integral advice

The IT landscape is evolving rapidly. IT specialists are working on all sorts of cloud variations: SaaS, IaaS and PaaS. Organizations and individuals are increasingly dependent on IT. IT enters into our personal life more and more. Law and regulation in the field of information security and privacy increases in size and complexity. Management needs to ensure that (personal) data is treated with care. Reputational damage due to IT problems is undesirable. In-house counsels must ensure that the rules are observed, especially when the new European privacy regulation comes into force, introducing a penalty of up to five percent of the global turnover. In some sectors, the rules are stricter than in other sectors, but in no sector the rules can be ignored.

Approach

Information security and privacy is a complex combination of technical issues, organizational context and legal frameworks which should complement each other when implemented. However, in practice incomplete controls are implemented, which cannot guarantee an optimal result. Therefore Madison Gurkha, ITSX and Louwers IP|Technology Advocaten have combined their individual strength and expertise to offer an integrated assessment of your IT environment combining privacy, security, organizational and legal aspects.

An integrated assessment visualizes the level of compliance within your organization and makes you understand the risks your organization faces and which steps are necessary or desirable to mitigate these risks now and in the future:

- Your existing IT environment: Do you comply with law and legislation and standards of good IT security practice and do you know all the risks?
- Your future IT environment: How should you set up a new IT application and what measures should be taken to ensure optimal result for security, organizational, legal and privacy practices in the future?

Based on your vision of the future, we like to create a roadmap for your organization, which guides you towards your own goal in manageable steps.

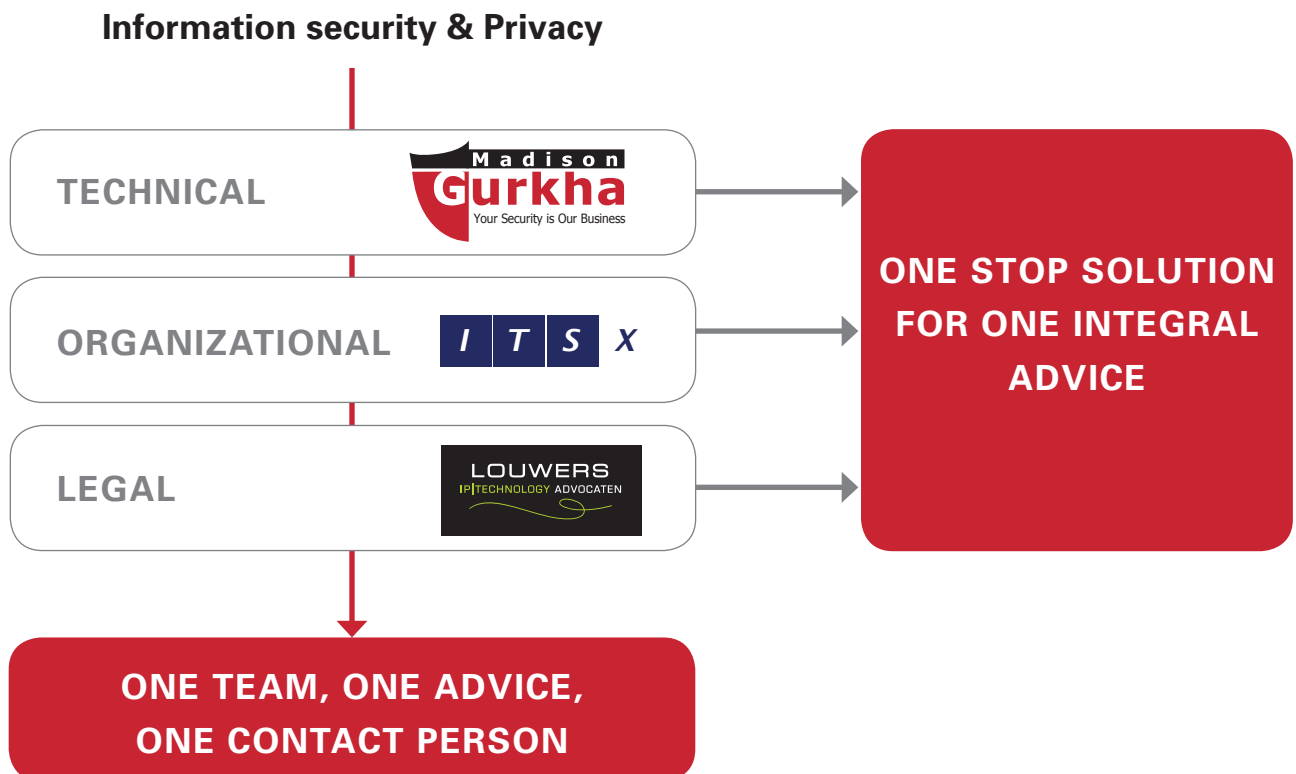

Did you ever ask yourself?

- *How vulnerable is our IT for malicious hacking, and how we can reduce that vulnerability?*
- *Is IT security and privacy sufficiently embedded in our business? If not, how can we improve it?*
- *Do we comply with the Data Protection Act (WBP)? If not, how do we realize that?*
- *Can I monitor the IT usage of my employees? What is allowed and what is not allowed?*
- *What (European) legislation can we expect in the near future and have I taken all that already into account?*

What can you expect?

At an administrative level, you get a clear overview of how your organization is compliant with the various aspects of privacy and information security, and what risks you are facing. The various disciplines in your organization get an in-depth advice and an understanding of how their domain fits in the overall picture. That combination gives the highest level of assurance that limited resources and budgets are used where they are most needed with the best return on investment for the entire organization.

At an organizational, technological and legal level, we will provide you with appropriate advice and suggestions for action, often based on international standards. From the risks that we see, we guide you to select and implement the right controls, and we monitor the effectiveness and efficiency of these controls. Our ultimate aim is to spend both budget and resources where these actually make a difference.
